

CSCI 185: Computer Programming II Fall 2020

Module 6 Lab 2: Exception Handling II – Write Your Own Exception Class

In this lab, our goal is to write an exception class by ourselves which inherits from the generalized Exception class. You should define an exception class which can capture at least three different exceptional cases for a bank account (such as deposit/withdraw negative amount, overdraft, opening the account with zero balance, etc.). Also define a bank account class with a main method, in which you will create a bank account example and demonstrate how your own exception class could help handle those different types of exceptions.
